

CAR CARE for SAFE DRIVING

1. Tire Pressure - *You should be on the mark!*

Know what your Tire Pressure should be. Check the pressure monthly since time and temperature can alter the pressure and effect tire safety and wear. Don't forget the spare!

2. Engine Air Filter - *Keep it Clear!*

A clean air filter can increase fuel efficiency by nearly 10%. It is recommended that an air filter be changed every 12,000 miles. Check your vehicle's manufacturer's recommendations for specific guidelines.

3. Battery - *Keep it Clean!*

The best way to keep your battery running smoothly is to keep it clean. Clean the terminals on regular intervals. If you do not think your battery is maintaining a charge, seek service for a battery inspection.

4. Engine Oil - *Check it - Change it!*

Engine oil specialists recommend changing your oil every 3,000 - 5,000 miles. Be sure to check your vehicle's manufacturer recommendation to keep your engine running clean.

5. Windshield Wipers and Windshield Fluid

If your wipers are leaving visible streaks or take several passes to clear away light rain, they need to be replaced. Be sure to maintain adequate windshield wiper fluid to clear road debris from your windshield.
